

Mesenchymal Stem Cells Therapy in Cisplatin-Induced Nephrotoxicity

Filesize: 7.88 MB

Reviews

The publication is straightforward in study better to fully grasp. It is definitely simplistic but excitement inside the 50 percent of your publication. It is extremely difficult to leave it before concluding, once you begin to read the book.

(Mazie Johns IV)

MESENCHYMAL STEM CELLS THERAPY IN CISPLATIN-INDUCED NEPHROTOXICITY

Book Condition: New. Publisher/Verlag: LAP Lambert Academic Publishing | A Histological, Ultra-structural and Biochemical Study in Adult Albino Rats | Stem cell therapy has the future to change the face of human diseases and alleviate suffering. Mesenchymal stem cells (MSCs) have generated a great deal of excitement and promise as a potential source for stem cell-based therapeutic strategies. These data provide the clue of using MSCs in the current work to modulate cisplatin-induced nephrotoxicity, the severest adverse effect of the well-known anticancer drug; cisplatin. Forty adult albino rats were used in this study; MSCs of bone marrow origin were injected into the rat tail vein one day after a single dose of intra-peritoneal injection of cisplatin. Four weeks later, the kidney was examined morphologically, histopathologically and ultra-structurally. Renal functions (urea, creatinine) as well as serum electrolytes levels (Na, K) were estimated. Cisplatin produced marked histopathological changes in rat kidney and impaired renal functions however; MSCs ameliorated cisplatin-induced nephrotoxicity both functionally and structurally to a great extent. MSCs have a potential therapeutic effect against cisplatin-induced nephrotoxicity. | Format: Paperback | Language/Sprache: english | 64 pp.
